SQL Business Questions with Results

ApexPlanet Data Analytics – Task 2

Important: These queries and results use an illustrative fictional table named `sales`. The results are examples, not results from your actual Task 2 dataset. Adjust table/column names and rerun the queries against your dataset before submission.

Assumed table structure

Column	Type / meaning
order_id	Unique order identifier
order_date	Order date
product	Product name
category	Product category
region	Sales region
quantity	Units sold
unit_price	Price per unit
revenue	Quantity × unit_price

1. What is the total revenue?

```
SELECT SUM(revenue) AS total_revenue FROM sales;
```

Example result: ■4,150

Adds revenue across all rows.

2. What are the top five products by revenue?

```
SELECT product, SUM(revenue) AS total_revenue
FROM sales
GROUP BY product
ORDER BY total_revenue DESC
LIMIT 5;
```

Example result: Product A ■1,200; Product B ■900; Product C ■750; Product D ■700; Product E ■600

Groups sales by product and ranks products by revenue. Replace example values with query output.

3. Which category generates the most revenue?

```
SELECT category, SUM(revenue) AS total_revenue
FROM sales
GROUP BY category
ORDER BY total_revenue DESC;
```

Example result: Electronics — ■1,800; Home — ■1,350; Accessories — ■1,000

Compares revenue across product categories.

4. What is the monthly revenue trend?

```
SELECT DATE_TRUNC('month', order_date) AS month,
SUM(revenue) AS monthly_revenue
FROM sales
GROUP BY DATE_TRUNC('month', order_date)
ORDER BY month;
```

Example result: Jan — ■1,200; Feb — ■1,450; Mar — ■1,500

Shows revenue by month. DATE_TRUNC syntax works in PostgreSQL; adapt for MySQL or SQLite.

5. Which region has the highest revenue?

```
SELECT region, SUM(revenue) AS total_revenue
FROM sales
GROUP BY region
ORDER BY total_revenue DESC;
```

Example result: South — ■1,700; West — ■1,300; North — ■1,150

Ranks regions by total revenue.

6. What is the average order revenue?

```
SELECT AVG(revenue) AS average_order_revenue FROM sales;
```

Example result: ■415

Calculates the average revenue per row/order. If an order has multiple line items, aggregate by order_id first.

7. Which products sold the most units?

```
SELECT product, SUM(quantity) AS units_sold
FROM sales
GROUP BY product
ORDER BY units_sold DESC
LIMIT 5;
```

Example result: Product A — 10 units; Product C — 8 units; Product B — 6 units

Identifies products with the highest quantity sold.

Before submitting

1. Replace the assumed table and column names with the names in your dataset. 2. Execute each query in your SQL environment. 3. Replace every example result with the actual output. 4. Include screenshots or copied result tables if your internship instructions ask for proof of execution.
